

Cabell County Schools (CCS) comprises 26 high-achieving public schools and centers that serve over 13,000 students. CCS relies on Hanover's custom research queue to address targeted questions specific to district goals. CCS leveraged Hanover's quantitative analysts to evaluate its employee absenteeism policy in order to increase district efficiency.

INVESTIGATING EMPLOYEE ABSENTEEISM

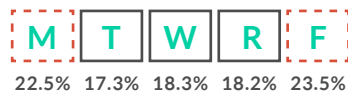

HANOVER APPROACH

Initial Research Questions: Employee absenteeism was costing CCS money, reducing substitute classroom fill-rates, and ultimately affecting the stability of students' learning environments. CCS needed an objective, third-party expert to analyze 14 years of district data and provide answers to key district absenteeism policy questions.

1. IDENTIFYING PATTERNS

At which times and among which locations does employee absenteeism appear greatest?

- **Organize** longitudinal district data to determine trends in employee absenteeism by day of the week.*

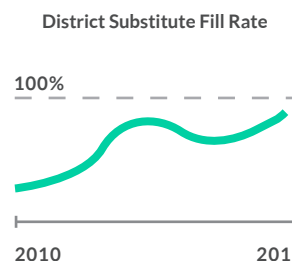

- **Segment** historical data by employee type to track distribution of absences by location, finding a high degree of similarity in absenteeism trends across all CCS locations.
- **Evaluate** absenteeism data by month to determine the average number of employee absences by month.

2. TRACKING FILL RATES

How often does CCS fill classrooms with a substitute when requested?

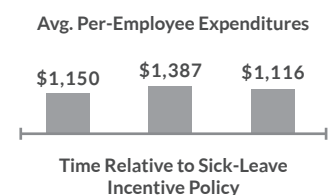

- **Measure** substitute fill rates for the following absence types:
 - Sick day
 - Personal day
 - Emergency
 - Docked
- **Track** CCS' progress toward reaching a 100% substitute fill rate.

3. QUANTIFYING EFFECTS

How did CCS' sick-leave incentive program influence employee absenteeism and impact costs?

- **Collect** total and per-employee district expenditures related to employee absenteeism.
- **Adjust** data for inflation to support longitudinal analyses.
- **Compare** average per-employee expenditures for periods before, during, and after sick-leave incentive program.

* Refers to absences specifically classified as "emergencies"

Return on Investment: CCS reduced inefficiencies associated with absenteeism by making data-informed changes to its employee absence policy. For example:

- Hanover's finding that average per-employee expenditures dropped after the sick-leave incentive program confirmed CCS's decision to discontinue this program.
- Hanover's finding that employees request emergency days disproportionately on Mondays and Fridays led CCS to require employees to produce a doctor's note after an extended period of emergency absences.

"When we first started with Hanover, I had high expectations for the return on our investment. Hanover's research is thorough yet accessible, and their custom reports always have key findings with actionable insights. Hanover's team of analysts provide sophisticated research that we simply could not do ourselves."

-Dr. H. Jeffrey Smith, Asst. Superintendent, School Improvement, Cabell County Schools
